

Work Outcomes Validation

Cefala, Kaur, Schofield & Shamdasani

May 29, 2026

1 Work variables

1.1 Building the work variable

We have four possible way to define the work variable at the daily level. These are (from most to least restrictive):

1. Only in person, ≤ 7 days recall [**Current definition in the paper/slides**]¹
2. In person and phone, ≤ 7 days recall
3. Only in person, including comprehensive recall
4. In person and phone, including comprehensive recall

The daily variable is then aggregated at the weekly level. **Note:**

- Implicitly, missing are treated as 0 when summing at weekly level
- Range for the weekly work variable is [0,7] because it includes Sundays, whereas it's [0,6] for attendance → worth mentioning when comparing magnitudes in the paper.

1.2 Attrition in work variable definitions

- Outcome in Table 1.1 is 1 if work variable definition (see above) is not missing on that day. Sample size is number of days in a phase. Table 1.2 controls only for stand and strata fixed effects.
- Outcome in Table 1.3 is total number of non-missing work days (according to the above definitions) in each Phase. Sample size is number of workers (225). Table 1.4 controls onlly for stand and strata fixed effects.

¹Even if we use this definition, the results are different from paper and slides because I found a bug in the code that Hao inherited from previous RA.

	Phase 1				Phase 2			
	(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)

1.3 Outcomes

- Table 1.5 reports the treatment effects in Phase 1 and Phase 2, where each variable is aggregated at the weekly level.
- Outcomes in Table 1.6 are defined as:

$$weekly_work_prorated = weekly_work \times 7 / non_missing_days$$

	Phase 1				Phase 2			
	(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)

Table 1.6: Different definitions of work – prorated

2 Labor supply

Outcome in Table 2.1 is defined as 1 if attend the stand or work, aggregated at the weekly level. Note:

- Because the work variable is defined on Sundays, the range of this variable is [0,7]. Table 2.2 excludes Sundays and holidays.
- Because the attendance variable is defined every day, we don't have missing data here.

Table 2.1: Labor supply = show up to stand or work

	Phase 1				Phase 2
